

Healthcare with Datashop

Guide to Datashop Applications

Contract Performance Reports

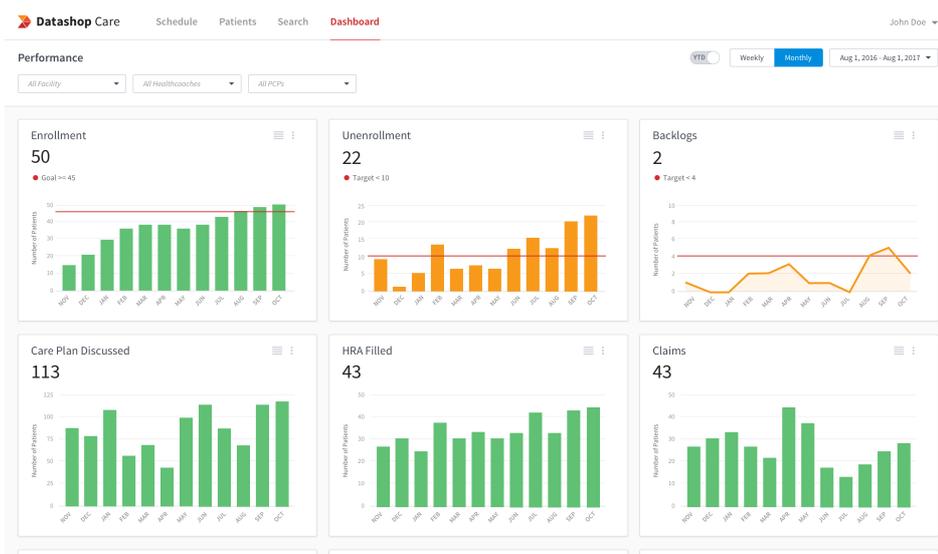

using Datashop Reports

It's paramount that healthcare organizations are aware of their performance and monitor it from time to time to pinpoint the areas of growth and shortfalls. Datashop is equipped with a reporting module that allows users to create reporting dashboards according to different attribution methodologies of each contract, summarized into state-of-the-art dashboards.

The dashboard supports drill-down facilities, allowing users navigate the organization by payor, geographic region, a facility, down to an individual provider with care gap lists over time, for every measure. With providers being able to see the reports pertaining to patient records and working off the same dashboard, the chances of uncoordinated care reduces drastically.

Through Datashop, dashboards can be customized according to the different contracting needs of different payers.

Datashop is compliant with 'need-to-know' basis and every data point can be locked or accessed based on organization hierarchical access.

Datashop dashboards helps you drill down the various quality and utilization measures of multiple contracts from an organization level to service location, provider, or even patient level.

Datashop's dashboards let users choose the measures they wish to track at the point of a click and lay them out in a card-like manner. Each of these measures and KPIs can be drilled down at the patient level to identify the patients qualifying under a certain measure and pinpoint the root cause behind a looming problem. The contract performance measure helps an ACO to track their performance on every payer contract, identify which network/facilities/physicians are underperforming so that they can take remedial actions to stay on the right course of action.

The dashboards are customizable by the users, giving them the autonomy on what metric or KPI they prefer to track and monitor their contract performance, observe variations and resource utilization, and track efficiency and growth of the organization. Involving end-users, Datashop's reporting module helps organizations learn about where they are going with built-in predictive analytics.

Datashop enables you to drill down to facility/provider level from a region/state level to identify the root causes.

Success Story

An Accountable Care Organization had shared-savings contracts with multiple payers. The ACO covered the facilities and clinics falling under these contracts, attributed with all the relevant measures negotiated under the contracts. The major challenge along the way was to identify the areas that needed urgent focus and remedial actions that were needed.

Datashop, with its ability to ingest all the payer claims data into the platform, combined 6 Payor contracts, spanning over more than 50 quality and utilization measures. Using the drill-down analysis of the claims, Datashop helped the organization figure out 5 substantial areas that needed attention, with their root cause within a week, and helped them design their priorities. By making use of Datashop's performance dashboards and drilled-down performance measure, the organization was able to bridge the gap in quality care delivery within 2 months, improving the quality performance by a good 27%, and driving better health outcomes for the community.

Contact Us

At Innovaccer, we create products that transform the way organizations use data. Our products and services are deployed at Hospitals, Accountable Care Organizations (ACO), Health Information Exchange (HIE), critical government, commercial, and non-profit institutions around the world to solve sophisticated and world changing problems. Simply put, we accelerate innovation through the power of data.
